Reverse Engineering and 3D Scanning

Organizer: ECoLab 4.0 Project
Speaker: Enrique González, PhD in Engineering.
Contact: ingmanuel@usal.es /toles@usal.es

February 20, 2025

15:15

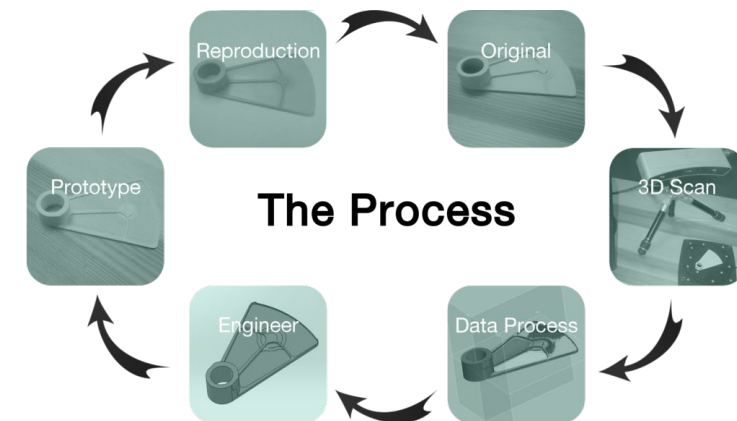

High Polytechnical School of Ávila, Spain

Introduction to Reverse Engineering

Definition: The process of deconstructing an object or system to understand its design, functionality, and components.

Importance in Industry: Enables part replication, product analysis of competitors, and design improvement.

Common Applications: Used in sectors such as manufacturing, automotive, aerospace, and medical fields for product development and optimization.

3D Scanners: Artec Eva and Space Spider

- Eva: A handheld structured-light 3D scanner, ideal for medium-sized objects.
- Spider: A high-precision handheld 3D scanner designed for small objects and intricate details.

Artec Eva

16 FPS capturing speed

Capturing and simultaneously processing up to an impressive 18 million points per second, Eva also provides high accuracy – up to 0.1 mm.

0.2 mm 3D resolution

Scan in brilliant color and high 3D resolution.

1.3 MP texture resolution

Make full-color 3D replicas of your object.

3D Scanners: Artec Eva and Space Spider

- Eva: A handheld structured-light 3D scanner, ideal for medium-sized objects.
- Spider: A high-precision handheld 3D scanner designed for small objects and intricate details.

Artec Spider

0.05 mm 3D point accuracy

Make extremely accurate 3D models of small industrial objects or sections of larger objects in fine detail.

No targets needed. Just point and shoot

No need for preparation, just plug in the scanner and point it at the item as you would with a video camera. Simple.

0.1 mm 3D resolution

Capture the geometry of your items with astonishing levels of 3D point density. Space Spider can even render the ridges of your fingerprint, that's how much detail it can pick up.
